

CAM FOLLOWERS

Technical features

Cam followers

Nadella cam followers are designed to run directly on various types of surface such as cams, ramps and slideways.

In order to satisfy the operating conditions imposed on this type of bearing - heavy radial loads usually accompanied by substantial and repeated shocks, the various Nadella cam followers have these common advantages:

- heavy section outer ring for carrying load and limiting deformations that reduce the load capacity of the bearing
- convex outer ring tolerating out-of-parallelism of contact surfaces or cylindrical outer ring for reducing contact pressure
- oil holes situated under the needles enabling lubricant replenishment through the shaft
- full complement of needles or rollers providing maximum dynamic and static load capacities

Cam followers can be equipped with an eccentric stud in order to allow setting the preload during the mounting. Cam followers can be equipped with plastic seals or metallic shields for retaining lubricant.

Besides the standard products in the catalogue, Nadella manufactures several variations for specific conditions of use.

Reference standards are:

ISO 7063 – Needle roller bearings – Track rollers – boundary dimensions.

TO USE AS FOLLOWERS

When the cam followers or the wheels are used for running on a rail or a cam, under the load there is a plastic deformation of the outer ring that reduces the load distribution between the rolling elements of the bearings. The tables in the following pages list two different values of the basic load of the bearing depending from the use and mounting.

- the load capacity **C** valued according to standard ISO 281 for bearings, for lifetime calculations when mounting with the cylindrical outer ring in a hole.
- the load capacity **C_w**, for lifetime calculations when mounting with the cylindrical outer ring running in contact with a cam or plain guide rail.

In addition to the load capacity of the bearing you must consider the strength of the outer ring and of the stud in the cam followers.

Dynamic limit load **F_r**: it is the load which should not be exceeded when follower is subject to repeated torques. Static limit load **F_{0r}**: it is the maximum strength limit that the follower can exceptionally support.

In case of use like a wheel the strength of the raceway must be considered. For more details, please ask to Technical Service Nadella.

Technical features

Cam followers

TYPES AND OPERATING CONDITIONS

Full complement needle followers types GC

These followers are recommended under following conditions:

- low speeds
- high radial loads
- oscillating motions

Convex outer ring (**GC**) or cylindrical (**GCL**)

With eccentric stud (**GCR** or **GCRL**)

Starting from dimension 16 can be equipped with contact plastic seals (suffix **EE**) or contact metallic shields (suffix **EEM**)

Single-row full complement roller followers types GCU

Their installation is especially recommended for:

- high speeds
- limited and intermittent axial loads
- heavy radial loads

Convex outer ring (**GCU**) or cylindrical (**GCUL**)

With eccentric stud (**GCUR** or **GCURL**)

With metallic shields (suffix **MM**)

Double-row full complement roller followers types NUKR.2SK

Their installation is especially recommended for:

- high speeds
- limited axial loads
- heavy radial loads

Outer ring with optimised profile with decreasing curvature from middle of the wheel

With eccentric stud (**NUKRE**)

With metallic shields (suffix **MM**)

Small single-row full complement needle followers type FP

Their installation is especially recommended for:

- low speeds
- heavy radial loads
- oscillating motions

Convex outer ring (**FP**) or cylindrical (**FPL**)

Single-row full complement needle followers type FG

Their installation is especially recommended for:

- low speeds
- heavy radial loads
- oscillating motions

Convex outer ring (**FG, FP**) or cylindrical (**FGL, FPL**).

Cam followers **FG** can be equipped with contact plastic seals (suffix **EE**) or contact metallic shields (suffix **EEM**).

Technical features

Cam followers

Single-row full complement roller followers type FGU (heavy and light series)

Their installation is especially recommended for:

- high speeds
- limited and intermittent axial loads
- heavy radial loads

Heavy series is different from light series for the thickness of the outer ring which determinates an higher external diameter and an higher load capacity.

Convex outer ring (**FGU**) or cylindrical (**FGUL**).

Inner ring and lateral shoulders built in a single piece.

Metallic shields (suffix **MM**).

Double-row full complement roller followers type NUTR

Their installation is especially recommended for:

- high speeds
- limited axial loads
- heavy radial loads

Heavy series is different from light series for the thickness of the outer ring which determinates an higher external diameter and an higher load capacity.

Convex outer ring (**NUTR**) or cylindrical (**NUTR.DZ**).

Inner ring in three parts, not separable.

Metallic shields.

Single-row full complement needle followers type RNA 11000

These followers useable without inner ring on a treated shaft, are available with an inner ring starting from a shaft diameter 12 mm, and their installation is especially recommended for:

- intermediate speeds
- heavy radial loads
- oscillating motions

MISALIGNMENT TOLERANCES

Followers with a convex outer ring permit displacement in relation to the track surface up to a maximum slope like for the following table:

Cam follower type	
RNA 11 000 B6	1.5 in 1000
RNAB 11 000	15 in 1000
FG, GC, GCU	7 in 1000

TOLERANCES ON OUTER DIAMETER

For all type of follower:

- convex outer ring h9 on dim. D
- cylindrical outer ring h7 on dim. D

Out of roundness in accordance to ISO 7063

ADVICE ON ASSEMBLY

Positioning of the radial lubrication hole

In cases where the follower is subjected to high loads, shock or vibration, the lubrication hole situated under the needles should be positioned outside the loaded zone. The lubrication hole which is not visible on the cam follower with threaded stud is parallel to the screwdriver slot in the head of the stud. Where the head of the stud has a hexagonal socket, the position of the lubrication hole is indicated by the marking by the hole.

Technical features

Cam followers

Lateral support of followers

For followers type **FGU** shoulders on the shaft or other parts serving to retain the follower on the faces of the inner ring should have an outer diameter not less than dimensions d_A . Where there is considerable axial load or operation is subject to vibration, this outer diameter should be equal at least to dimension d_A listed in the tables.

For followers of **FG** series shoulders on the shaft should be equal at least to dimension d_A .

For the correct mounting of followers of **NUKR** series tighten axially the bearing, the minimum diameter advised for locking is d_A listed in the tables.

CAM FOLLOWERS GC, GCU AND NUKR SERIES

Tolerance on hole housing

The stud should fit easily into the hole in the mating member having a bore of tolerance H7. To ensure contact over the entire surface area of the yoke, the supporting face of the mating member should have a diameter of at least equal to dimension d_A . The locking torque applied to the nuts, as shown in the table of dimensions, is calculated to provide effective fixing of the follower.

Cam followers GC GCU NUKR series	Dimension d
Without eccentric stud	d H7
With eccentric stud	d1 H7

CAM FOLLOWERS FG FGU RNA1000 NUTR

Shaft tolerances

Cam followers NUTR FP FG FGU series	Dimension d
Load fixed in relation to the inner ring	h5 / h6
Load rotating in relation to the inner ring	k5 / j6
Load fixed in relation to the inner ring, moderate loads, high strength shaft	g6
Load fixed in relation to the inner ring, light loads, unhardened shaft, loose transition fit	f6

For RNA 11000 fitted with inner ring	Dimension d
Load fixed in relation to the inner ring	h5 / h6
Load rotating in relation to the inner ring	k5 / j6

For RNA 11000 without inner ring	Dimension Fw
Hardened and ground steel shaft	h5

The cylindrical tolerance, defined as the difference in radii of two coaxial cylinders (ISO Standard 1101), should normally be less than a quarter of the manufacturing tolerance. However, for high precision or high speed applications it is advised to restrict this tolerance to one eighth of the manufacturing tolerance.

LUBRICATION - OPERATING TEMPERATURE

Type **RNA 11000** followers are supplied with a coating of protective grease compatible with a lithium base grease.

As for the bearings the protective grease is not suitable for lubrication of the wheels.

All types of wheels and cam followers, with or without seals are supplied lubricated with a grease permitting operation in temperatures from -20 to +120°C. In the versions with metallic shields or in synthetic material (**EE-Teflon**) the exercise limit depends always on the lubricant. On request, these followers can be supplied with greases for high or low temperatures, or without grease (but protected against rust).

In any case, at temperatures of 150°C and above, cam followers must be specially heat treated and calculation of life should take account of reduced load capacity (consult Nadella Technical Department).

Use of a special grease for high temperatures may reduce the limiting speeds shown in the tables of dimensions.

The metallic shields **...EEM ...MM** enables operation up to 200°C with a suitable lubricant.

Technical features

Cam followers

ECENTRIC STUDS

To provide radial adjustment of the outer ring toward the hole of the housing at the time of installation, track rollers are available with eccentric bushing added to the track roller stud fitted with interference. In this way the position of the bearing can be settled for a value of $\pm k$. The eccentric bushing closes the lubrication hole on the stud.

As a standard eccentric bushing are supplied already mounted on the stud.

ACCESSORIES FOR FOLLOWERS

Cam followers with lubrication hole are supplied with cap and grease nipple. Insert the one or the other in the appropriate end seats in function of the side from which the lubrication will be performed.

The cap is completely inserted for all its length by pressure.

The nipple has instead a step that is not within the length of the hole for the portion that protrudes of 2.5 mm dimension h.

Cam followers of **GC** series and derived from dimension 16 up to 28 mm inclusive has a single axial hole at its top end for a grease nipple and a screw driver slot. The nipple protrudes from the edge of the head.

Cam followers of **GC** series, from diameter 30 mm and **GCU** series, with a hexagonal socket on head side, the nipple protrudes only if mounted on the stud side.

In cam followers **NUKR** series the nipple is always hid in the hexagonal socket.

The radial hole in the stud, if not used, is closed by the housing of the cam follower.

Concentric cam followers **GC GCU** and **NUKR** series are supplied with two nuts.

Eccentric cam followers **GCR GCU** **NUKRE** series are supplied with eccentric bushing, one nut, one lock washer, one flat washer

1) Designation for cam followers

NUKR..2SK Concentric cam follower with profiled outer ring

NUKRE..2SK Eccentric cam follower with profiled outer ring

2) Hole diameter for mounting the concentric follower: d H7

Hole diameter for mounting the eccentric follower: d1 H7

3) Dimension of the stud with eccentric bushing

4) Minimum recommended abutment diameter in case of axial loads or vibrations

5) For concentric rollers only (without eccentric bushing)

Roller cam followers NUKR..2SK

1) Designation

NUTR Convex outer ring

NUTR.DZ Cylindrical outer ring
