

Inch roller bearing units SYE, SYR, FYE and FYR series

Bearing type

- Spherical roller bearings, 222 series

Shaft diameter range

- 1 7/16 to 4 15/16 in.

Typical shaft-bearing combinations

- Plain shaft, bearing fixed using either the locking collar method or the SKF ConCentra locking method

Seals

- Triple-lip
- Labyrinth
- Radial shaft seal

Lubrication

- Grease

Mounting

- Two-bolt mounting
- Four-bolt mounting

Material

- Grey cast iron

Compliance to standards

- Not standardized

SKF inch roller bearings units are robust, ready-to-mount units that are assembled, lubricated and sealed at the factory for maximum service life. With their simple and safe installation and easy alignment, they are an excellent alternative to sleeve-mounted bearings in split housings. The assortment for inch shafts includes SKF ConCentra units and collar-mount units.

**Units of measurement**

In this chapter only imperial units are used. To convert imperial units to metric units, refer to the conversion table on **page 10**.

Inch roller bearing units SYE, SYR, FYE and FYR series

Standard bearing unit design

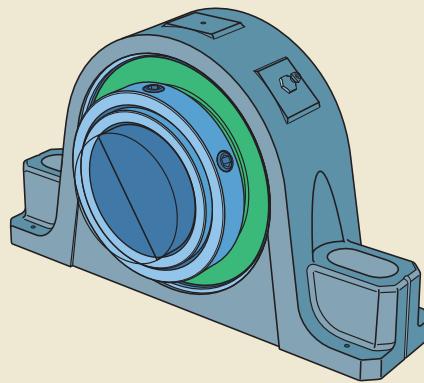

SKF inch roller bearing units consist of a non-split housing, an SKF spherical roller bearing in the 222 series, seals and grease. The bearings are fixed to the shaft using either the locking collar method or the SKF ConCentra locking method (designation suffix N). Inch roller bearing units are available in different series and designs:

- Pillow (plummer) block units with two bolt holes in the base are available in two series. Units in the SYE and SYE .. N series are available for shafts ranging from $1\frac{7}{16}$ to $3\frac{1}{2}$ inches (→ **fig. 1**). Bearing units in the SYR and SYR .. N series are available for shafts ranging from $1\frac{7}{16}$ to 4 inches (→ **fig. 1**).
- Four-bolt base pillow (plummer) block units in the SYE series, designation FSYE and FSYE .. N, are available for shafts ranging from $2\frac{7}{16}$ to $4\frac{15}{16}$ inches (→ **fig. 1**).
- Square flange units (FYE series) are available for shafts ranging from $1\frac{7}{16}$ to 4 inches (→ **fig. 2**).
- Round flange units (FYR series) are available for shafts ranging from $1\frac{7}{16}$ to 4 inches (→ **fig. 2**).
- Piloted flange units (FYRP series) are available for shafts ranging from $1\frac{7}{16}$ to 4 inches (→ **fig. 2**).

SKF ConCentra locking method

The SKF ConCentra locking concept is based on two sets of inclined planes (serrations): one set in the bearing bore, the other on the stepped sleeve. When the set (grub) screws in the mounting collar are tightened, the bearing is displaced axially, forcing the inner ring to expand. This does two things: it sets the correct internal clearance within the bearing and it exerts pressure on the stepped sleeve, forcing it to contract around the circumference of the shaft for a true concentric, tight fit (→ fig. 3). On the opposite side are set (grub) screws for dismounting. An engraving marked "MOUNT.SIDE/DISMOUNT.SIDE" shows the mounting and dismounting sides of the unit.

Locking collar method

The locking collar method uses a collar mounted on the extended inner ring of the bearing (→ fig. 4). The extended inner ring has two holes, 62° apart. The collar has two matching tapped holes, each containing a set (grub) screw. When the set (grub) screws are fully tightened, the shaft is held firmly against the inner ring of the bearing.

Features and benefits

SKF roller bearing units share some of the following features and benefits:

Ready-to-mount

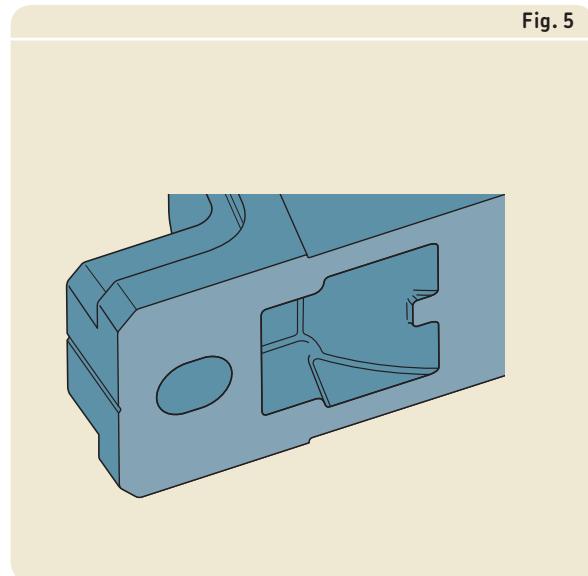

SKF roller bearing units are assembled, greased and ready-to-mount, saving time and reducing the risk of contaminating or damaging the bearing during installation.

Simple mounting

The bearing units can be used with commercial grade shafts and are located easily on the shaft by tightening the set (grub) screws in the mounting collar or locking collar.

Stiff housing

The housing base is reinforced with ribs and the area around the attachment bolt holes is strengthened to minimize the risk of cracking caused by over-tightening the attachment bolts (→ fig.5).

Sealing solutions

Easy replacement

With SKF inch roller bearing units, logistics costs are reduced as there is only one part to order, store and mount.

Housing material

All housings used for SKF inch roller bearing units are made of grey cast iron.

Paint, corrosion protection

The housings are painted blue (RAL 5007) using a water based alkyd/acryl paint. The paint protects the housing in accordance with ISO 12944-2, corrosivity category C2 (i.e. exterior atmospheres with low level of pollution, interior atmospheres where condensation may occur). The paint is not affected by most lubricating or engine oils, cutting fluids or alkalescent washing chemicals. Housings can be repainted with most water or solvent based 1- or 2-component paints.

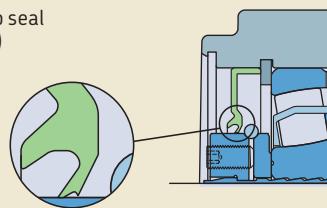

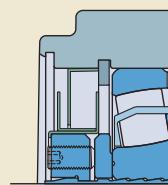

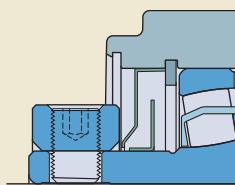

Unpainted surfaces are protected by a solventless rust inhibitor.

Sealing solutions

SKF roller bearing units are available with different sealing solutions (→ fig. 6):

- triple-lip seals (TriGard)
- labyrinth seals
- radial shaft seals (garter spring seals)
- end plugs

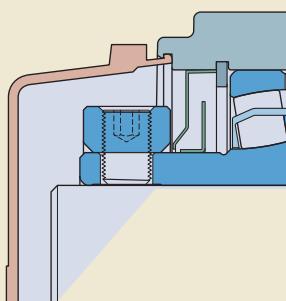

Fig. 6

Table 1 provides an overview of the characteristics and suitability of each sealing solution. Details are provided in the following text. This information should be used as a guideline and does not substitute for testing a seal in its application.

plugs are identified by the designation suffix Y. For information about the permissible length of the shaft end, contact the SKF application engineering service.

TriGard seals

TriGard seals are standard with inch roller bearing units. These acrylonitrile-butadiene rubber (NBR) seals have the outside surface and seal lips vulcanized to a sheet steel insert. The seal consists of two lips that make contact with the mounting collar or bearing inner ring, and a third, non-contact lip, to protect the seal lips from coarse contaminants. The rubber coated outside circumference secures the seal in the housing and enhances the sealing effect.

Labyrinth seals

As labyrinth seals do not generate friction, bearing units fitted with these seals are capable of relatively high speed operation.

For SKF ConCentra units, the labyrinth is created with three sheet steel rings. Two rings are fixed to the mounting collar or back-up collar and rotate with the shaft to act as flingers. The third ring is secured in the housing bore.

For collar-mount units, the labyrinth is created with two sheet steel rings. One ring is pressed onto the extended inner ring and rotates with the shaft, acting as a flinger. The other ring is secured in the housing bore.

Radial shaft seals (garter spring seals)

Collar-mount units can be supplied with radial shaft seals on both sides, on request. The seals are made of acrylonitrile-butadiene rubber (NBR) and have no metal reinforcement. They sit firmly in the housing bore providing a static seal. The spring-loaded seal lip provides a dynamic seal against the inner ring shoulder.

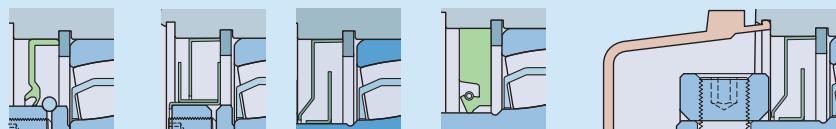

End plugs

Bearing units mounted at the end of a shaft should have an end plug (end cover). End plugs for units up to $2\frac{15}{16}$ inches are plastic, while larger sizes are steel. Bearing units with end

Inch roller bearing units SYE, SYR, FYE and FYR series

Design considerations

For general information about system design, refer to the following sections:

- *Typical shaft-bearing combinations* ([→ page 41](#))
- *Locating/non-locating bearing arrangements* ([→ page 40](#))
- *Load carrying capacity* ([→ page 44](#))
- *Specifications for shafts and housing support surfaces* ([→ page 45](#))

Bearing life

For information about the SKF rating life, minimum load and static safety for bearings in SKF inch roller bearing units, refer to the product information available online at skf.com/bearings. The bearing data are listed in **tables 2** and **3**.

Typical shaft-bearing combinations

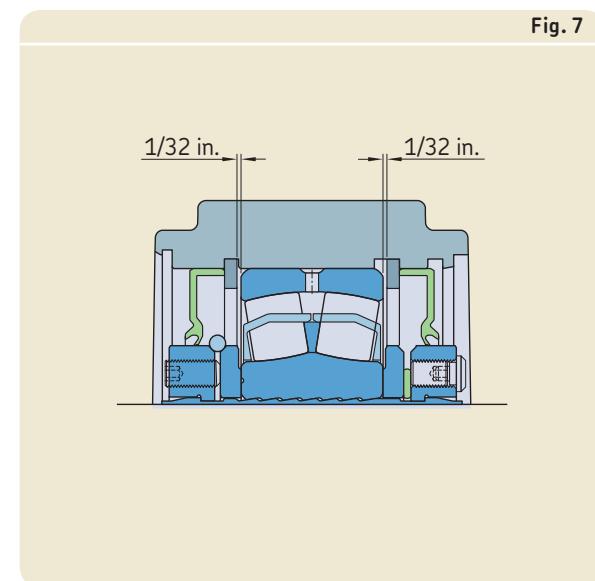

SKF inch roller bearing units are designed for plain shafts.

Locating and non-locating bearing positions

SKF inch roller bearing units can be used for both the locating and non-locating bearing positions. Bearing units for the non-locating bearing position have a wide bearing seat to accommodate $1/32$ in. of axial displacement, in either direction from the central position ($1/16$ in. maximum) ([→ fig. 7](#)).

Bearing units for the locating bearing position are identified by the designation suffix L . Units for the non-locating bearing position have no suffix.

Design considerations

Load carrying capacity

Pillow (plummer) blocks

SKF pillow block roller bearing units are intended for loads acting perpendicularly toward the support surface. If the bearing unit is supported over its entire base and the loads are purely perpendicular, loads are limited only by the bearing.

If loads acting in other directions occur, be sure that the magnitude of the load is permissible for the housing and the attachment bolts. Guideline values for the safe loads of the housings are provided in **tables 4 to 6**. The safe loads have been calculated using a safety factor of 5 against fracture.

If the bearing unit is not supported over its entire base, the load carrying capacity for perpendicular loads may be affected. For additional information, contact the SKF application engineering service.

For a purely axial force, static or dynamic, the permissible load on the housing should not exceed 65% of P_{180° .

Additional housing support

When the housing is subjected to loads acting parallel to the support surface, it may be necessary to pin the housing to the support surface or to provide a stop to counter the load.

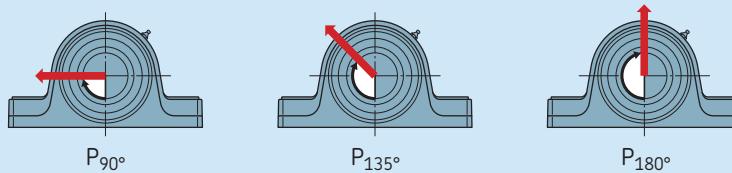

When loads act at angles between 55° and 120°, or when the axial loads are greater than 5% of P_{180° (\rightarrow **tables 4 to 6**), the bearing unit should be pinned to the support surface. The dowel pins should be sufficiently strong to accommodate the loads acting parallel to the support surface.

Flanged units

For the safe loads of flanged units, contact the SKF application engineering service.

Table 6

Inch roller bearing units SYE, SYR, FYE and FYR series

Axial holding power

The axial holding power of SKF ConCentra roller bearing units depends on the friction between the shaft and locking device. It is therefore also dependent on the number of set (grub) screws in the mounting collar (→ **table 7**).

For collar-mount units, the axial holding power is determined by the size of the set (grub) screws (→ **table 8**). The values are valid for unhardened shafts after the set screws have been tightened to the recommended torque value.

When mounted correctly, the bearing units can withstand typical shock loads equivalent to the requisite axial holding force. However, the axial load carrying capacity of the bearing unit can be limited by the bearing.

Radial internal clearance

The clearance values for bearings in SKF inch roller bearing units are provided in **tables 9** and **10**. The values are valid for unmounted units under zero measuring load.

Table 8

Axial holding power of collar-mount roller bearing units

Shaft diameter from in.	to	Set screws Number	Number	Size	Tightening torque in-lbf.	Axial holding power ¹⁾ lbf.

4 7/16	4 1/2	0.0028	0.0047
4 15/16	5	0.0035	0.0057

Design considerations

Operating temperature

The permissible operating temperature is limited by the seals (→ **table 1, page 699**) and the lubricant (→ **table 13, page 706**).

The housing material does not have any additional temperature limits, except for very low temperature applications where impact strength could be a factor.

The housing paint is heat resistant up to 175 °F material temperature or 210 °F ambient temperature.

When temperatures outside the permissible range are expected, contact the SKF application engineering service.

Operating speed

The speeds at which SKF inch roller bearing units can be operated depend on the sealing solution in the bearing unit. For bearing units fitted with TriGard or radial shaft seals, the limiting speeds are based on the permissible circumferential speed at the seal lips (→ **table 1, page 699**). For bearing units fitted with labyrinth seals, the limiting speeds are imposed by the bearing size and grease.

Guideline values for the limiting speeds are listed in the product tables.

Shaft specifications

For SKF ConCentra units, SKF recommends using the shaft tolerances listed in **table 11** for the bearing seat. For collar-mount units, use the values listed in **table 12**.

A small lead-in chamfer should be machined at the shaft end to facilitate mounting.

Attachment bolt recommendations

In typical applications, 8.8 class (SAE J429, Grade 5) hexagon head bolts can be used together with washers. If the load does not act perpendicularly toward the base, it may be necessary to use stronger, 10.9 class (SAE J429, Grade 8) bolts.

SKF inch roller bearing units can withstand loads resulting from tightening the attachment bolts to the torque values recommended by bolt manufacturers. They are valid for oiled, but otherwise untreated, thread surfaces. SKF cannot guarantee that tightening to the recommended value will provide sufficient anchoring. Make sure that attachment bolts, dowels or stops, and a sufficiently strong support can accommodate all occurring loads.

Inch roller bearing units SYE, SYR, FYE and FYR series

Lubrication

SKF inch roller bearing units are intended for grease lubrication.

Initial grease fill

SKF inch roller bearing units are filled with a mineral oil based lithium grease that contains EP additives. The initial grease fill at the factory fills the bearing completely and 40 to 50% of the free space in the housing. The technical specifications of the grease are provided in **table 13**. The grease provides reliable performance when operating between 95 and 230 °F. During start-up, temperatures down to -5 °F are permissible. For short periods, temperatures above 230 °F can be tolerated.

For additional information about permissible temperatures of rolling bearing greases (the SKF traffic light concept), refer to the information available online at skf.com/bearings.

Relubrication

SKF inch roller bearing units are typically relubricated in order to realize maximum service life. All bearing units except those in the FYRP series have a lubrication hole with a 1/8-27 NPSF thread. They are provided standard with a grease fitting AH 1/8-27 PTF. Units in the FYRP series have a 1/4-28 UNF straight thread, and are provided with a grease fitting 1/4-28 UNF.

Relubrication intervals

To calculate the relubrication intervals refer to *Relubrication intervals under Metric roller bearing units* (→ page 676). The relevant calculation factors for SKF inch roller bearing units are provided in **tables 2** and **3** (→ page 701).

Relubrication procedure

Before relubricating, the grease fitting and the area surrounding it should be cleaned. High-pressure cleaning equipment should be avoided. During relubrication, grease should be introduced via the grease fitting while the shaft is rotating slowly. Excessive pressure and over-greasing should be avoided, otherwise the seals may be damaged.

Table 13

Technical specifications for the grease in SKF inch roller bearing units

Ordering information

Relubrication quantity

The appropriate quantity of grease for relubrication of SKF inch roller bearing units is provided in **table 14**.

Greases for relubrication

To relubricate SKF inch roller bearing units, SKF recommends using SKF LGEP 2 grease, which is fully compatible with the original grease introduced at the factory. Other compatible greases such as SKF's multipurpose LGMT 2 and LGMT 3 greases can also be used.

Mounting

SKF inch roller bearing units must be mounted properly using the appropriate tools and state of the art mechanical mounting methods. All the associated components must also meet certain basic requirements (→ *Specifications for shafts and housing support surfaces* on **page 45**). Mounting instructions are provided with each unit.

The mounting collar on SKF ConCentra roller bearing units is equipped with M6 set (grub) screws, the number of which depends on the size of the bearing unit. SKF recommends using a torque wrench to tighten these set (grub) screws. The tightening torque is 66 in-lbf. A specially designed hexagonal key 3L, in accordance with ISO 2936, with a torque indicator is supplied with each bearing unit.

CAUTION: Do not tighten the set (grub) screws until the bearing unit is positioned on the shaft. If the screws are tightened prematurely, the stepped sleeve may deform.

The locking collar of collar-mount units is equipped with two set (grub) screws, the size of which depends on the bearing unit size. SKF recommends using a torque wrench to tighten these set (grub) screws. Recommended tightening torque values are provided in **table 8** (→ **page 704**).

Condition monitoring

SKF inch roller bearing units support condition monitoring during operation. For additional information about condition monitoring and the measurement tools and systems available from SKF, contact the SKF application engineering service.

Accessories

The following accessories are available for SKF inch roller bearing units:

- Grease fitting M1 1/8 NPTF
- Automatic lubricators
- Grease meter: LAGM 1000E
- Condition monitoring sensors

For additional information, refer to *SKF tools and products* (→ **page 47**).

Ordering information

SKF inch roller bearing units are supplied assembled, greased and ready-to-mount.

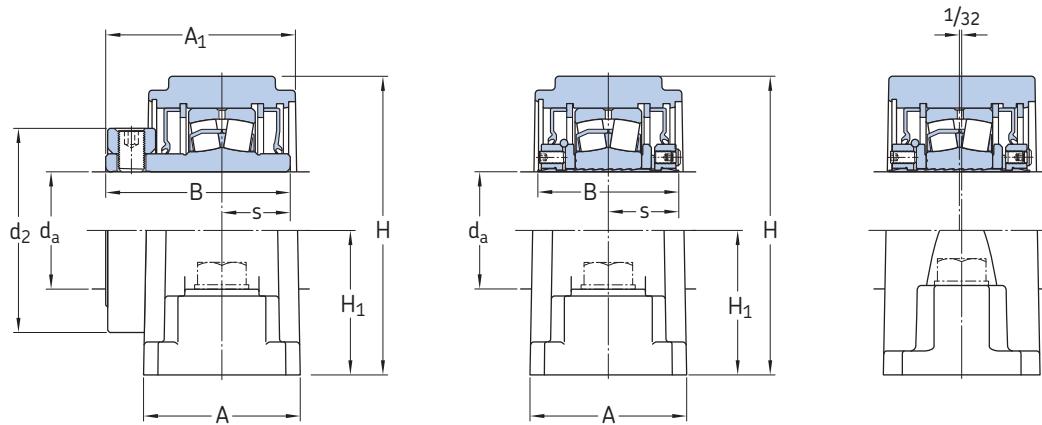

Order example

Two SKF ConCentra roller bearing units with a pillow (plummer) block housing in the SYE series are required for a 2 in. shaft diameter. The units should be fitted with labyrinth seals. One bearing unit will accommodate the bearing in the non-locating position at the end of the shaft. The other bearing unit will accommodate the bearing in the locating position on a through shaft.

The following items should be ordered:

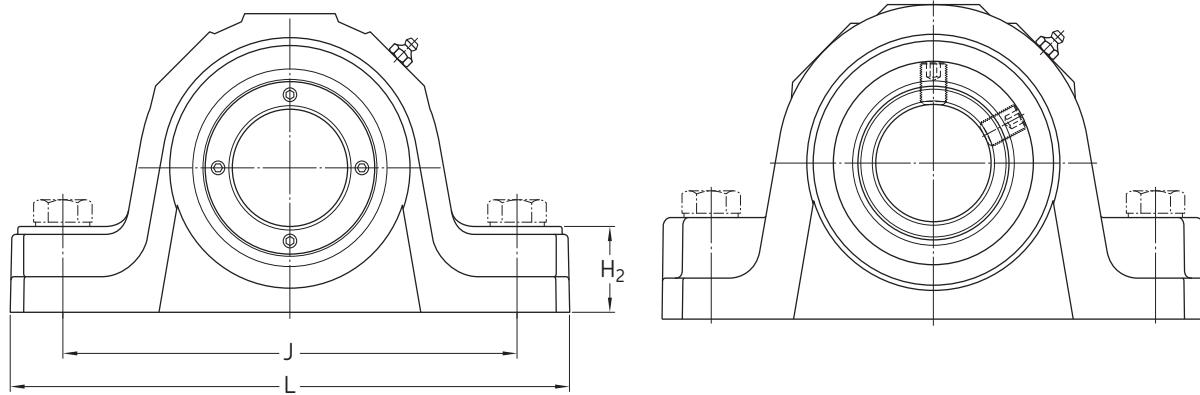

- 1 bearing unit SYE 2 NY -118
- 1 bearing unit SYE 2 NH -118
